

- Ex 11.1.2:
- a) bcbcd
 - b) bcabed
 - c) bcd
 - d) bedcabc
 - e) bcgfeolcb
 - f) bedcb

Ex 11.1.4: Starting with string with only 0's we can get to any string of weight 2 where the weight of a string is the sum of its digits.
→ More generally two connected have their weight that differs 0 or 2.

→ Strings with even weight are connected

→ Strings of odd weight are connected

And thus two components are disconnected.
So we get 2 components for G .

Ex 11.1.6: The vertices at distance 1: e, f, g

// 2: h, o
// 3: l, m, j, i
// 4: i

Ex 11.1.10: For example $a \rightarrow b \rightarrow c$

Ex 11.1.16: a) For W_3 there are 3 k -cycles given by $v_1 v_2 v_3 v_4 v_1$ and rotating.

For W_4 : there are 4 k -cycles given by $v_1 v_2 v_3 v_4 v_1$ and rotating and one that doesn't pass through v_5 :
 $v_1 v_2 v_3 v_4 v_1$.

For W_5 : there are 5 k -cycles given by $x_1 x_2 x_3 x_4 x_1$.

b) ⁽¹⁾ There are n cycles of length k in W_n given in the same way by rotating around the wheel.

(ii) There are $n+1$ cycles of length n on W_n given by the outer cycle and rotating cycles that pass through the center.

Ex 11.2.2: a) If there is an edge between vertices of G_2 in G that is not in G_2 .

Ex 11.2.6: with 0 edges: $\begin{matrix} \cdot & \cdot \\ \cdot & \cdot \end{matrix}$

Complement

There are 11 graphs 1 edge: $\begin{matrix} \cdot & \rightarrow & \cdot \\ \cdot & & \cdot \end{matrix}$

2 edges: $\begin{matrix} \cdot & \dashrightarrow & \cdot \\ | & & \cdot \\ \cdot & & \cdot \end{matrix}$

$\begin{matrix} \cdot & \dashrightarrow & \cdot \\ \cdot & \dashrightarrow & \cdot \end{matrix}$

3 edges: $\begin{matrix} \cdot & \dashrightarrow & \cdot \\ | & \searrow & \cdot \\ \cdot & \dashrightarrow & \cdot \end{matrix}$

$\begin{matrix} \cdot & \dashrightarrow & \cdot \\ \cdot & \dashrightarrow & \cdot \end{matrix}$

$\neq W$

Ex 11.2.9: a) We can choose any vertex to start (7 choices). The second vertex in the path can be any other (6 choices). We can continue this way to get:
$$\frac{7 \times 6 \times 5 \times 4 \times 3}{2}$$

b) The same reasoning gives:

$$\frac{n(n-1) \dots (n-m+1)}{2}$$

Ex 11.2.10: K_n has $\binom{n}{2}$ edges, so

\bar{G} has $\binom{n}{2} - e$ edges.

Ex 11.2.12: a) We should have

$$\binom{n}{2} - e = e \quad \text{so}$$

$$e = \binom{n}{2} / 2$$

c) We have from a) that $\binom{n}{2}$ is divisible by 2.

$$\text{But: } \binom{n}{2} = \frac{n(n-1)}{2}$$

So n or $n-1$ is divisible by 4
hence $n = 4k$ or $n = 4k+1$.
